1.Create a comparison table listing the main differences between DDR3, DDR4, and DDR5 RAM, including speed, voltage, and typical use cases.

Feature	DDR3 RAM	DDR4 RAM	DDR5 RAM
Speed	800–2133 MT/s	1600–3200 MT/s	3200–6400+ MT/s
Voltage	1.5 V (DDR3L: 1.35 V)	1.2 V	1.1 V
Performance	Slowest of the three	Faster than DDR3	Generally the fastest
Power consumption	Highest of the three	Lower than DDR3	Lower standard voltage than DDR4
Typical use cases	Older computers and laptops	Many desktop PCs and laptops	Newer gaming PCs, modern laptops, and high-performance computers

3. List three key differences between HDD, SSD, and NVMe storage types, and for each, name one app or use case (from apps you use daily) that would benefit most from that storage type.

Feature	HDD	SSD (SATA)	NVMe SSD
1. Speed	Slowest; uses spinning disks.	Faster; uses flash memory.	Usually the fastest; connects through PCIe.
2. Durability	Less shock-resistant because it has moving parts.	More shock-resistant because it has no moving parts.	More shock-resistant because it has no moving parts.
3. Cost and use	Cheaper; best for storing large files, videos, and backups.	Moderate cost; good for Windows and everyday applications.	Usually costs more; best for demanding games and heavy applications.
Example use case	Storing movies, photos, and backups.	Opening Chrome or Spotify quickly.	Loading games like PUBG faster and handling large video-editing projects.
