1.Draw a labeled diagram of a desktop PC, clearly marking the motherboard, CPU, RAM, GPU, and both HDD and SSD storage components.

**2.Create a comparison table showing the main differences between HDD and SSD storage in terms of speed, durability, and typical use cases.

Hint: Think about which one is faster, which is more shock-resistant, and where you would usually find each type (laptop, gaming PC, etc.).**

Feature	HDD (Hard Disk Drive)	SSD (Solid State Drive)
Speed	Slower because it uses spinning disks to read and write data.	Much faster because it uses flash memory.
Durability	Less shock-resistant because it has moving mechanical parts.	More shock-resistant because it has no moving parts.
Typical use cases	Used for storing large amounts of data, backups, photos, and videos at a lower cost.	Used in modern laptops, gaming PCs, and computers where fast boot times and quick loading are important.
Cost	Generally cheaper per GB.	Generally more expensive per GB.

Noise	Can make spinning or clicking sounds.	Silent during operation.

Both gaming pc and laptops contains hdd and ssd hdd is basically used to store permanent data for example if you want to store any image and any file it is basically stored into the hdd whereas while running the data or program ssd is used it is basically volatile for example while downloading the game all the file necessary to run the game are stored in the hdd and while starting the game it is loaded into the ssd.

3.Write a short explanation (2-3 sentences each) describing the role of the CPU, RAM, and GPU in running a game like PUBG or Free Fire on a PC.

A CPU is a central processing unit which process all the actions done in the game it sends the signal that player needs to run or crouch
A RAM is a random access memory it is where our game would be loaded. More RAM helps us to run our game smoothly
GPU is a graphical processing unit. It handles the graphic and how does a game look it usually handles the graphics of the game also leading in higher fps

4.Imagine you want to upgrade your PC to run the latest version of FIFA smoothly. List which hardware components you would consider upgrading and explain why for each.

If we want to run FIFA smoothly in our pc the parts that are to be replaced are
RAM – to run thr game alongside other applications and also to prevent any lags
GPU – for better graphics and smooth gameplay
CPU – to handle the game mechanics more smoothly and more precise
SSD – to load the game faster
power supply – if CPU requires more power we would need a better power supply
